Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENUER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

FILE REFERENCE: CL001307

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

PRIOR APPLICATION NUMBER: 60/231,498

PRIOR REPLICATION NUMBER: 60/231,498

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

                                                                                                            ADG39839
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a comprising the recombinant DNA construct and a method of producing a transformed plant ccomprising the recombinant DNA construct and a method of producing a transformed plant is a crop plant construct and source. The plant is a crop plant ccombinant DNA construct and property. The plant is a crop plant ccombinant DNA construct is useful for improved plant, where the polynucleotide or polypeptide is useful for producing plant with the ccombinant DNA construct is useful for producing plant with the recombinant DNA construct is useful for producing plant properties. Cc The recombinant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. ingroved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of carbohydrate, nitrogen or content, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and available propertial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic company of the printed specification but was obtained in electronic company.
                                                                                                                                                                                                                                                                                                                                                                                                  Matches

The invention relates to a new isolated polypeptide comprising an amino acid sequence selected from 17 fully defined human NOVX sequences (even SEQ ID NOS between ADG39770 and ADG39802), a mature form of the NOVX amino acid or a variant of NOVX, where one or more amino acid residue in the variant differs in no more than 15% of the amino acid residues of NOVX. Also included are an isolated nucleic acid (NA) molecule (comprising a nucleic acid sequence encoding a NOVX polypeptide above (odd SEQ ID NOS between ADG39769 and ADG39801), a nucleic acid fragment encoding at least a portion of a NOVX polypeptide and a complement of NOVX NA), a vector comprising NOVX NA, a cell comprising the vector, an antibody that immunospecifically binds to NOVX, a method for determining the presence or amount of NOVX or NOVX NA in a sample, a method of identifying an agent that binds to NOVX, a method for identifying an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New NOVX polypeptides and nucleic acids, useful for diagnosing or treating e.g. cardiomyopathy, atherosclerosis, hypertension, scleroderma, obesity, prostate cancer, AIDS, bronchial asthma, Crohn's disease, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mehraban F,

                                                                                                                                        밁
                            Ś
                                                                                                                                                                in diagnostics as expressed sequence tags for identifying expressed couseful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABC00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the first of the invention.

                                                                                                                                        Sequence 178 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to new Proteus mirabilis polypeptides and polynucleotides. The invention also relates to antibodies against the polypeptides, methods for producing the polypeptides, a method of generating vaccines for immunising an individual against P. mirabilis, a method for evaluating a compound for the ability to bind a P. mirabilis polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polynucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial drugs or as bio-control agents for plants. This sequence represents a Proteus mirabilis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Proteus mirabilis polypeptides and polynucleotides, useful reagents for diagnosis of bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC For example, a synthetic polydactyl protein containing six zinc finger CC domains can recognise an 18 by sequence, and such proteins are potentially highly gene-specific. The novel nucleotide-binding zinc CC finger proteins may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches CC gene-specific transcriptional regulators. Such transcriptional switches CC gene-specific transcriptional regulators. Such transcriptional switches CC gene-specific transcriptional switches convergence such as erbs-2. CC overexpression of which is involved in malignant transformation. The CC proteins are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat CC viral infections by inhibiting the synthesis of viral gene products. They can be used in producing functional gene knockout or activation in CC heterozygous transgenic animals. Proteins of the invention can CC used in producing functional gene knockout or activation in CC discriminate between sequences which have a single base difference. This cis sequence. Gene activation and repression can be achieved by targetting CC expressed sequence tags may be sufficient for the construction of gene Switches. Sequences AAB02876-B02869 represent zinc finger alpha helix CC phage library peptides disclosed in the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                achieved through specific contacts from side chains of amino acid residues in the alpha helix. Each zinc finger can recognise a subsite of the sinc finger domains 3 bp in target DNA. Covalent linkage of multiple zinc finger domains allows the recognition of extended contiguous asymmetric DNA sequences.
                                                                                                                                                                                                                                                                                                                   16-OCT-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an expression of nucleotide sequence that contains sequence 5' (GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5' (GNN)n-3'. The present
                                                                                                                                                                             The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 library; multimeric DNA binding polypeptide; zinc finger DNA binding peptide; gene expres gene expression enhancement.
                                                                                                                   Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                                       New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 7

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02895 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for

                                                                                                                                                                                                                                                                                               partner of the hyperimmune serum reactive antigen or its fragment, for the generation of a peptide (e.g. anticalines) binding to the antigen or fragment, or for the manufacture of a functional nucleic acid selected from aptamers and spiegelmers. The nucleic acid molecule may also be used for the manufacture of functional ribonucleic acids, such as ribozymes, antisense nucleic acids and sixNA. ADRB3733-ADRB4189 represent S. pyogenes hyperimmune serum reactive antigens, fragments and the encoding polynucleotide described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel nucleic acid molecule encoding a hyperimmune serum reactive antigen or its fragment from Streptococcus pyogenes. The nucleic acid molecule or hyperimmune serum-reactive antigen or its fragment are useful for the manufacture of a pharmaceutical preparation, especially a vaccine, against S. pyogenes infection. In addition, the hyperimmune serum reactive antigen or fragment is used for the isolation and/or purification and/or identification of an interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid molecules encoding hyperimmune serum-reactive antigens from Streptococcus pyogenes, useful for diagnosing, preventing and treating S. pyogenes infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2004-653698/63.

                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises the amino acid sequence of proteins from the hyperthermophile Methanopyrus kandleri, the invention also comprises the complete genome from Methanopyrus kandleri. The Methanopyrus kandleri proteins of the invention are useful for enhancing the stability and/or activity of other proteins. The Methanopyrus kandleri genome is useful i a variety of diagnostic and analytical methods. The present amino acid sequence represents a Methanopyrus kandleri protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acids encoding any of about 1700 Methanopyrus kandleri proteins, and the encoded proteins, useful as a medicaments as diagnostic agents.

                                                                                                                                                       CC (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in Ct the specification. The proteins have antibacterial and antiinflammatory cativity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and continuous that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

CC Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detect Streptococcus in a composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity control of treated may be meningitis. Nucleic control of the contro

CC For example, a Synthetic polydactyl protein containing six zinc filiger CC domains can recognise an 18 by sequence, and such proteins are coptentially highly gene-specific. The novel nuclostide-binding zinc CC finger proteins may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches CC may be used to regulate the expression of oncogenes such as erbs-2. CC overexpression of which is involved in malignant transformation. The CC proteins are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat CC viral infections by inhibiting the synthesis of viral gene products. They can be used in DNA-based diagnostic applications. The proteins may also be used in producing functional gene knockout or activation in CC discriminate between sequences which have a single base difference. This is manifested in a >100-fold decrease in affinity for the variant CC sequence. Gene activation and repression can be achieved by targetting CC within the gene transcript, suggesting that information obtained from CC switches. Sequences AAB02876-B02889 represent zinc finger alpha helix cc phage library peptides disclosed in the invention Sequence 7 AA; achieved through specific contacts from side chains of amino acid residues in the alpha helix. Each zinc finger can recognise a subsite 3 bp in target DNA. Covalent linkage of multiple zinc finger domains allows the recognition of extended contiguous asymmetric DNA sequence DNA sequences subsite

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an expression of nucleotide sequence that contains sequence 5' (GNN)n-3', in which n is 1-6, is regulared by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                                                             The invention comprises a library of multimeric DNA binding polypeptid (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silenct target gene expression. The present amino acid sequence represents a z finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          library; multimeric DNA binding polypeptide; zinc finger DNA binding peptide; gene expression gene expression enhancement.
                                                                                                                           Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-FEB-2003; 2003WO-US003705

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for regulating gene function.

Disclosure; Fig 1; 48pp; English.

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKF (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

APPLICANT: MATC J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO:
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE, REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-18
PRIOR FILING DATE: 1998-07-27
NUMBER: OF SEQ ID NOS: 33142
SEQ ID NO 30735
LENGTH: 425
TYPE: PRT
Sequence 7590, Application US/09621976
Patent No. 6639063
Patent No. 6639063
GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Jobert, S.

                                                                                                                                                                            The invention relates to novel foetal polypeptides encoded by polynucleotides comprising one of 477 sequences fully defined in the specification. The foetal polynucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. osteoporosis), thrombolytic disorders, nervous system disorders and inflammation. The present sequence is a polypeptide encoded by a CDNA assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue CDNA libraries
                                                                                                                                                                                                                                                                                                        Novel fetal proteins useful for the treatment and diagnosis of diseases associated with dysfunction of the protein e.g. cancers, immune disorders, growth disorders, thrombolytic disorders, nervous system disorders and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                  Yeung

                                                                                                                                                                                                                                                                                                                                       The invention relates to novel foetal polypeptides encoded by polynucleotides comprising one of 477 sequences fully defined in the specification. The foetal polynucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders (e.g. osteoporosis), thrombolytic disorders, growth disorders etc. osteoporosis), thrombolytic disorders, polypeptide encoded by a cDNA assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue cDNA libraries

                                                                                                                                                                                             Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as chisper to the protein of the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

ABM49671
The invention relates to an isolated polynucleotide (ACF64435-ACF64731) CC encoding a Propionibacterium acnes protein. The invention also relates to CC polyneptides encoded by the polynucleotides (ABM35624-ABM64356) and to immunogenic fragments of P. acnes polypeptides. The invention CC additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; antibodies gainst polypeptides of the invention; an immune response specific for a P. acnes comprising a polypeptide of the invention; a comprising a polypeptide of the invention; a cc polypeptide and an isolated T cell population comprising T cells prepared comprising P. acnes polypeptides, comprising T cell populations, or cc antigen-presenting cells that express the polypeptides, a method and kit for detecting or determining the presence or absence of P. acnes in a cc patient; and a method for inhibiting the development of P. acnes in a cc patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion cc proteins, T cell populations or antigen-presenting cells that express the culgaris, or for stimulating an immune response specific for a P. acnes composition. The polymucleotides can also be used as probes or primers for composition of an immune response specific for a P. acnes concerned the kit is useful for performing a diagnostic assay. The present cc sequence represents a polypeptide predicted to be encoded by an ORF (open creating frame) contained within the P. acnes polymucleotides of the convention. Note: The sequence data for this patent did not form at directly from WIPO at ftp. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaria, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mitcham JL, Skeiky YAW, Pers

Each zinc finger can recognise a subsite of CC 3 bp in target DNA. Covalent linkage of multiple zinc finger domains CC allows the recognition of extended contiguous asymmetric DNA sequences. CC for example, a synthetic polydactyl protein containing six zinc finger domains can recognise an 18 bp sequence, and such proteins are finger cC domains may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches CC may be used to regulate the expression of oncogenes such as erbB-2, CC werexpression of which is involved in malignant transformation. The CC proteins are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat CC viral infections by inhibiting the synthesis of viral gene products. They CC may be used in DNA-based diagnostic applications. The proteins may also be used in producing functional gene knockout or activation in CC discriminate between sequences which have a single base difference. This is manifested in a -100-fold decrease in affinity for the variant CC within the gene transcript, suggesting that information obtained from CC expressed sequences AAB02876-B02869 represent zinc finger alpha helix cc phage library peptides disclosed in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                         The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         library; multimeric DNA binding polypeptide; zinc finger DNA binding peptide; gene expression silencing; gene expression enhancement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 7 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an expression of nucleotide sequence that contains sequence 5'-(GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present
Sequence 7
                                                                                                                                                                          New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                             07-FEB-2003; 2003WO-US003705
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Unidentified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucreotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                             Disclosure; Fig

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for
